

CargoHub manages the warehouses for one of the largest supermarket chains in the Netherlands. We operate 10 warehouses that serves as a link between our suppliers and about 300 supermarkets and have some exciting expansions planned for the near future, including talks with two potential new clients.

Our current Warehouse Management Software (WMS) tracks all items moving through our warehouse from the moment they leave the factory until the moment they arrive at the supermarket.

Our current WMS, however, is showing its limitations. Among others, there is no proper user management, there have been occasional problems where our database got corrupted, and our dashboards have become unworkably slow.

The company that developed the WMS has since gone bankrupt and is unreachable. Unfortunately they only left us with the code. There is no documentation our tests. As the API is used extensively throughout our warehouse it is of utmost importance that the API remains compatible with the current software.

To ensure compatibility we would like to ask you to first properly document the current functionality and add appropriate testing. After that we would like you to set up an automated build and test environment that can be used to ensure continuous quality control.

Using these we ask you to first recreate the existing API in a way that serves as a proper foundation for you to build on. After that we would like you to improve the API by addressing the main issues we are facing and extending its functionality for the future.

The exact choices for tools and programming languages are up to you, but we will stay in touch throughout the project to ensure we will get the best results.

We are looking forward to working with you!

Yours Sincerely,

Team CargoHub
